Taking those
dangerous high risk site inspections
out of the project work flow.

An innovative product to contribute
to Zero Harm in the workplace.

SiteSee: Contributes to the pursuit of 'Zero Harm'

SiteSee™ is quickly becoming the standard in safety for mining and engineering sites around Australia and the world. SiteSee generates a virtual tour through the use of 360° spherical imaging technology.

This technology supports the pursuit of Zero Harm by increasing the outcomes and accuracy of desktop studies and reducing the need of onsite visits.

The 360° views offered by SiteSee enable users to visualise features as if they were actually there. It has been proven as a safe method of visualising hazardous sites and an efficient way of 'walking through' a remote site.

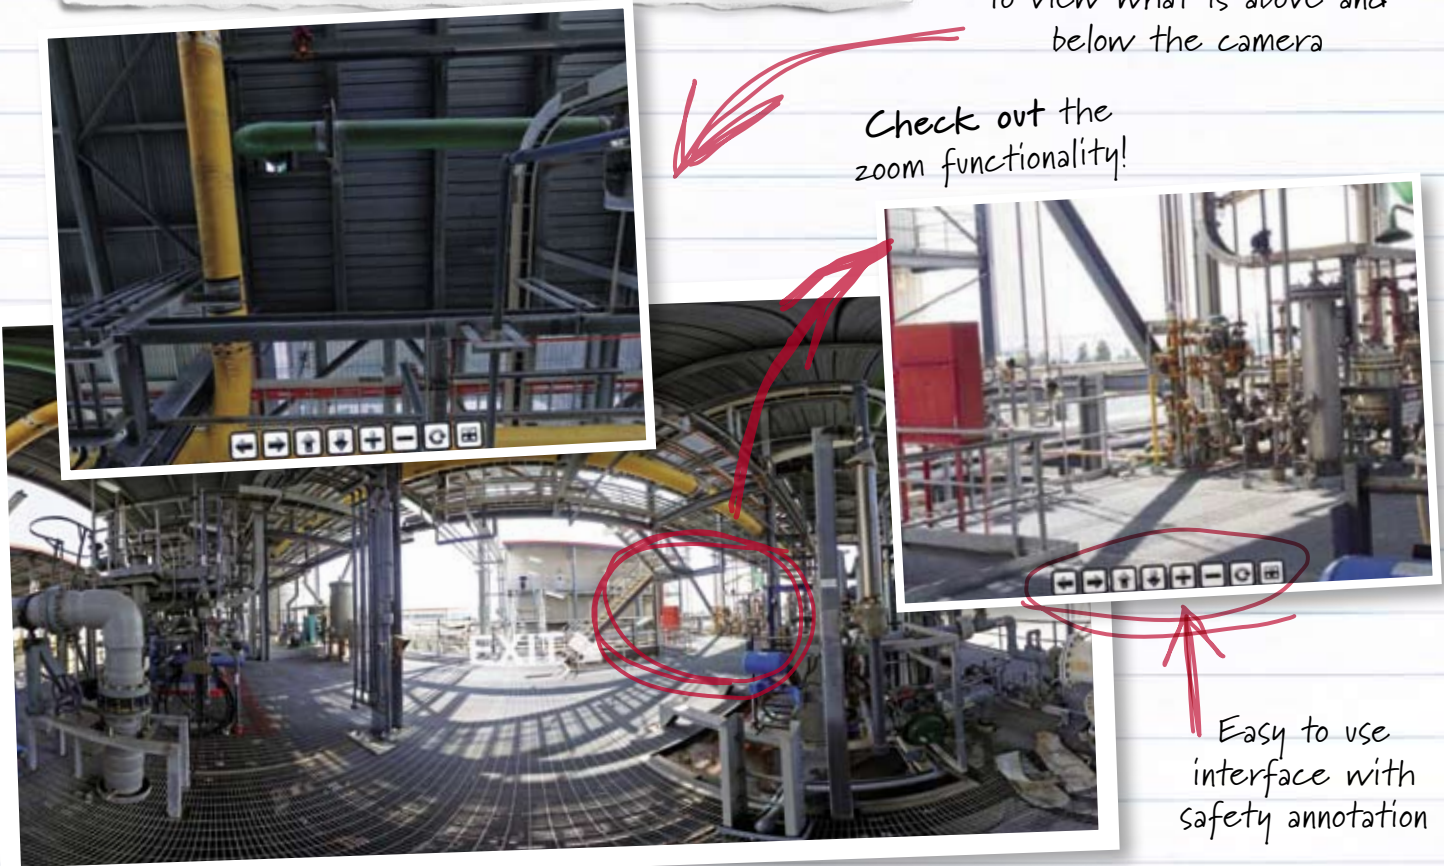

The spherical imagery can be accurately georeferenced by a navigation system that is connected to the camera. This permits the imagery to be integrated with GIS or Virtual Earth™/Google Maps™.

We use the latest equipment and technologies

Total 360° views – easy to view what is above and below the camera

Check out the zoom functionality!

Easy to use interface with safety annotation
